Besides Virtual Machines and what I use Arch Linux, you can at least, besides virtualbox, run a Live USB Ventoy with Watt OS Linux to reduce your Government Footprint, this just works, make sure you are the latest 64 Bit Version, it will Screen Tare in ("VM") so use a Live USB then do not install it, installing it defeats the purpose, then add these simple hacks, Spoof your mac address to Random, set a DNS to 888844, install in Firefox Ublock Origin, Privacy Badger, Decentraleyes, Canvas Blocker, RYTD, then get the Tor or Brave Browser Appimage and run Tor Node to hide more info, it defeats the purpose to install the OS, for now I just run Arco Arch Linux as a Live ISO9660 to Ram Disk then get online quickly and do my bidding, On my main installed systems I use LUKS Drive Encryption, a Sudo Password for the Root and USER, I close all my ports as shown in my ("nmap") scan, I do what I gotta do, my browsers were always conventional and the tracking was just for ("convenience") they were Chromium, Brave, Firefox, Tor, and that is what I always ran as I have bills to pay and stuff to take care of as rendering certain parts of web does not work on other browsers so I have to use conventional stuff, My ("/etc/hosts") is modified to Block Most Trackers also so I do my computing the way I do it, SSD only LUKS, also Watt OS vs Puppy Linux you can see Initial Ram Usage is less, yet Watt OS gets more critical updates and there was a recent kernel patch for linux that was posted to the CVE so the latest Watt OS is the best pick as you get the latest version it will do the job, having outdated deprecated software is a bad idea, that is why I am on Arco Linux of course, latest and greatest means that thing posted to the CVE will be patched and I don't have to worry about deprecated software, again this is what I do, nothing special I still think you will always get average numbers on X86_X64, even with MIPS and ARM and Risc and Sparc you will still get average numbers as hackers have gotten better at their craft, and yeah you can still get Comodo or Clamtk for your Linux System, and Windows and Mac have always been the biggest Malware Magnets along with Android, and Graphene OS is what most phone users change to. This will be The Footer EOF ... ;
